

CBCT Basics for the General Practitioner

Cone-beam computed tomography (CBCT) has revolutionized the way we see our patients by providing a tridimensional visualization of the teeth, jaws, and maxillofacial region. This course is intended for general dentists and other healthcare providers who are considering incorporating the tridimensional exams to their patient management, and those who just want to learn more about this fascinating imaging modality. We will provide an overview of the CBCT foundations so that you can confidently decide when and how to take advantage of the benefits of this technology while meeting your individual needs. We will discuss the advantages and limitations of CBCT, and what you need to consider while selecting the best machine for your practice. Even though this is not a CBCT interpretation course, we will also review some of the most common clinical indications and diagnoses.
